## SS1 • Classifying shapes

Mathematical goals

To help learners:

- name and classify polygons according to their properties;
- develop mathematical language to describe the similarities and differences between shapes;
- develop convincing explanations as to why combinations of particular

These goals may be adapted for learners aiming at lower levels. For example, you may decide to focus on just the first two goals. properties are impossible.

Starting points No prior learning is needed.

Materials required For each learner you will need:

- mini-whiteboard.

For each small group of learners you will need:

- Card set A - Shapes;
- some blank cards;
- Sheet 1 - Classifying by symmetry;
- Sheet 2 - Classifying by regularity;
- Sheet 3 - Classifying triangles;
- Sheet 4 - Classifying quadrilaterals;
- Sheet 5 - Classifying by perimeter and area.

The whole group discussion will be easier if you make OHTs of Card set A - Shapes and of the five sheets.

Approximately 1 to 2 hours, depending on how many classification grids (sheets) are used.

## Suggested approach

Learners aiming at lower levels may do only the first sort, with two descriptions.

## Beginning the session

Ask learners to work in pairs. Give each pair of learners Card set A Shapes. Ask them to sort the shapes into two groups using criteria of their own choice. Next, ask them to sort each group into two, using further criteria. Give out blank cards and ask learners to write a description of each of their four groups and also to draw another shape to add to each group.

## Whole group discussion: reviewing names and notation

Ask learners to share their criteria for sorting the shapes. Show how their four groups may be displayed using two-way tables. Help them to translate what they say into 'official' mathematical language such as:

- names of polygons (triangle, rhombus, regular etc.);
- names of angles (interior, exterior, acute, obtuse, reflex);
- terms for symmetry (line, rotational);
- terms that relate to lines (adjacent, equal, parallel, perpendicular).

Describe the notations that are commonly used to describe pairs of equal lengths, equal angles, right angles and parallel sides. Ask learners to label some shapes in this way. For example:

## Working in groups

Ask learners to work in pairs. Give each pair one of the Sheets 1 to 5. Ask them to place shapes into appropriate cells. Sometimes, several shapes may go in a cell. If learners feel that a cell is impossible to fill, they should explain why this is so.

Learners who struggle may be asked to find shapes corresponding to one criterion at a time (e.g. "Regular or irregular?"). When they have done this, they might then be encouraged to use two-way classifications such as those found on the grids.

Learners who find the task straightforward should be pressed for clear, written explanations as to why certain combinations of criteria are incompatible. This can be very challenging.

Listen to learners' explanations. Note obvious misconceptions that emerge for the final whole group discussion. For example, many learners assume that a parallelogram has a line of symmetry.

## Reviewing and extending learning

Using mini-whiteboards, ask learners to show examples of:

- a quadrilateral with two lines of symmetry;
- a triangle with three lines of symmetry;
- a right angled isosceles triangle;
- a triangle with all acute angles;
- a shape whose interior angles add up to $360^{\circ}$;
- a trapezium with only one right angle (impossible!);
- a quadrilateral with one reflex angle;
... and so on.

## What learners might do next

## Further ideas

There are of course many other ways of classifying shapes. You may like to suggest that learners invent methods of their own. For example, they could try to draw a table showing 'number of lines of symmetry' against 'order of rotational symmetry'. This is quite hard to fill in, as there are many impossible entries.

Classification activities are very powerful and can be used across the curriculum. For example, you could ask learners to classify and name sets of numbers, graphs, equations and so on.
