We will use a theodolite to calculate the **total height** of the wall.

Virtual site Classroom

leeds metropolitan university

We also use a **levelling staff,** which is a large ruler.

It is placed **vertically**, directly under the tallest point of the wall.

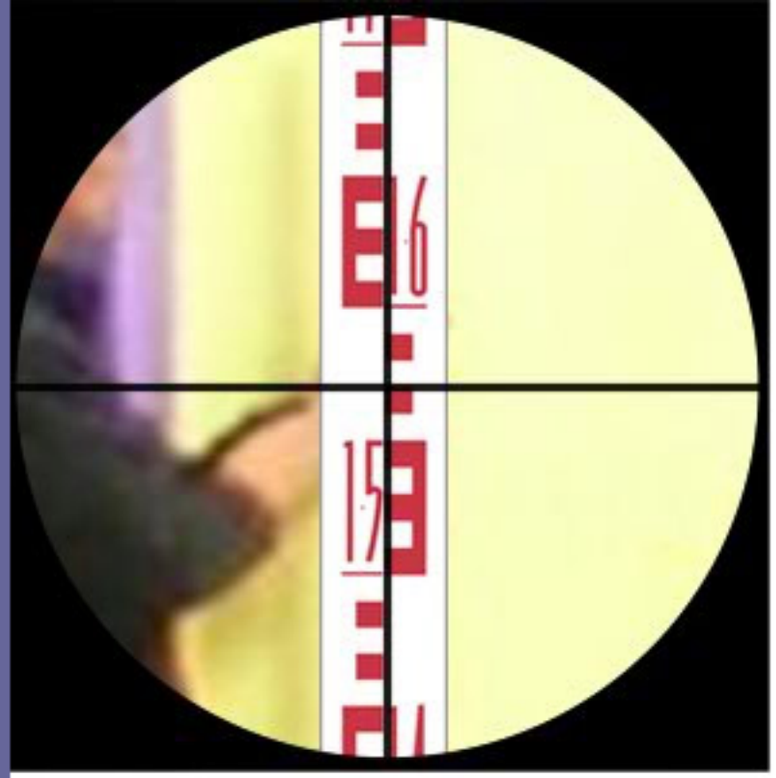
The distance between each large number on the staff represents 100 millimetres or 0.1 metre

Each block represents 10 millimetres

The staff is printed in black and red to help distinguish between the metre sections.

Virtual site Classroom

leeds metropolitan university



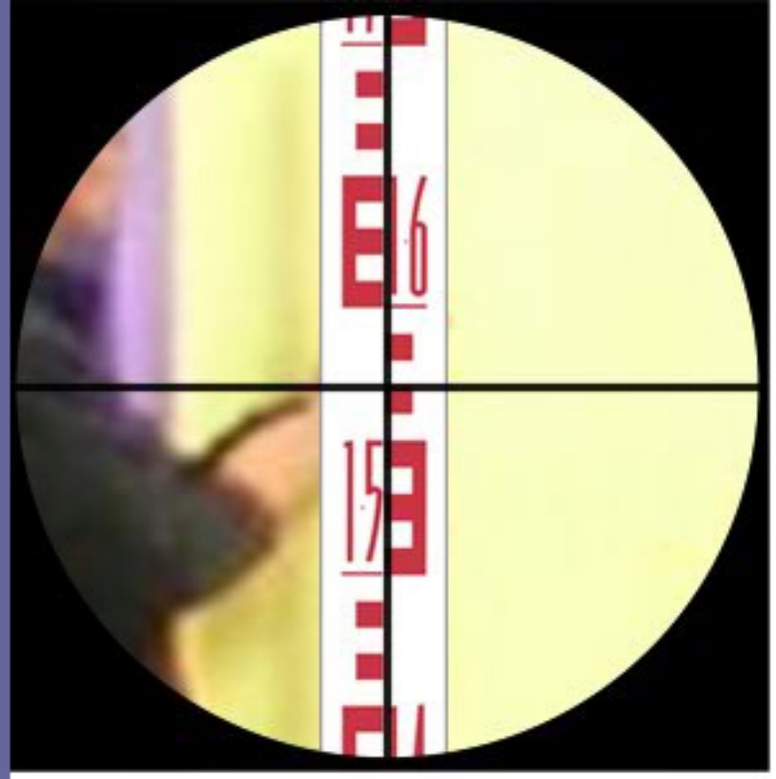
We align the theodolite view to **horizontal,** then focus onto the staff.

What is the staff reading? (2dp)

m

Virtual site Classroom

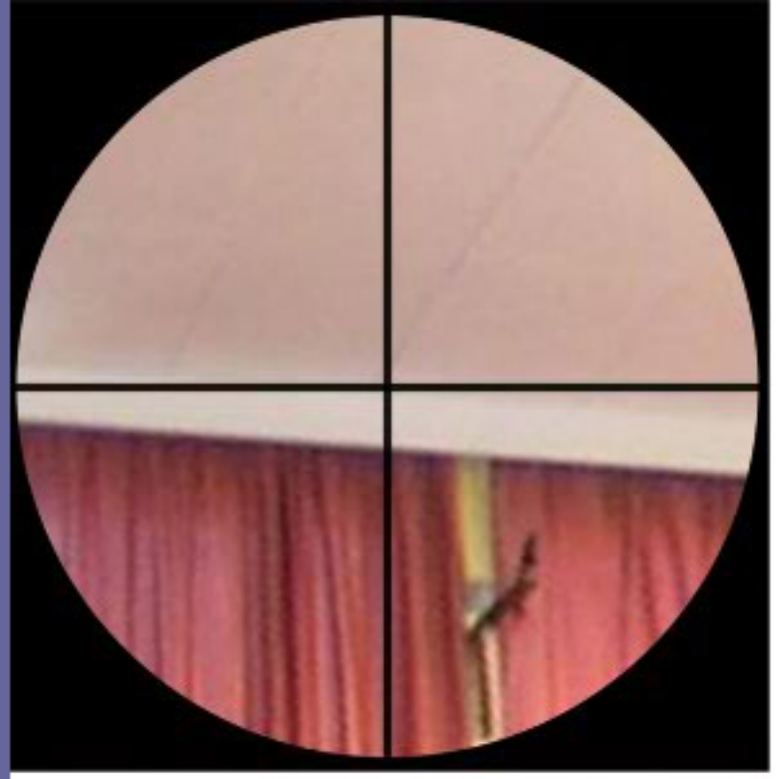
leeds metropolitan university



The reading of **1.57m** we took from the staff is the distance from the ground to the bottom of the blue triangle.

Virtual site Classroom

leeds metropolitan university



We then point the theodolite viewer at the top of the wall and align the crosshairs to it.

Virtual site Classroom

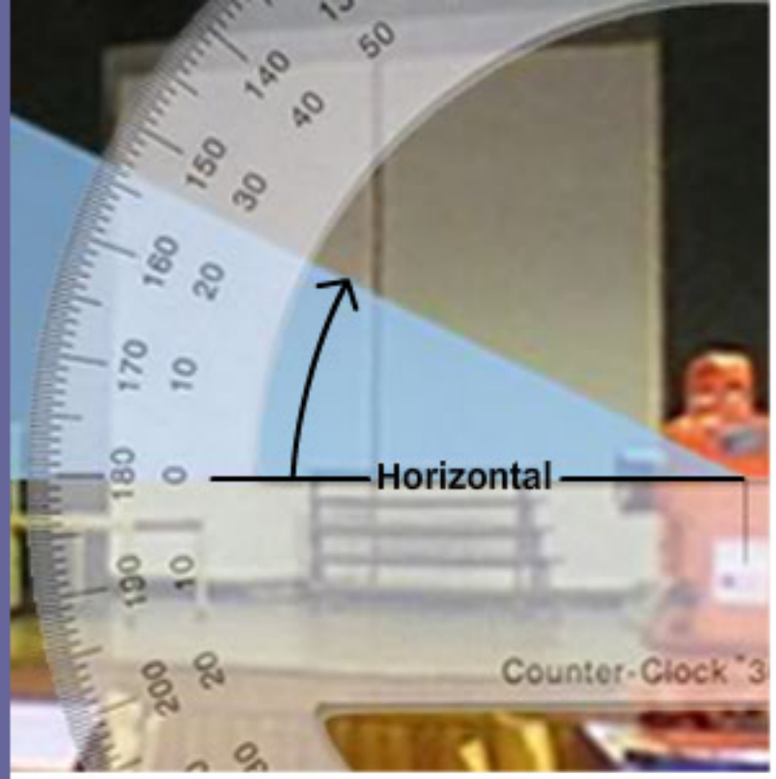
leeds metropolitan university

The theodolite display gives a digital readout of the angle between horizontal and the top of the wall.

It measures angles from its central axis, which its telescope rotates around.

Virtual site Classroom

leeds metropolitan university



The angle between horizontal and the top of the wall that the theodolite has measured is represented in the diagram above.

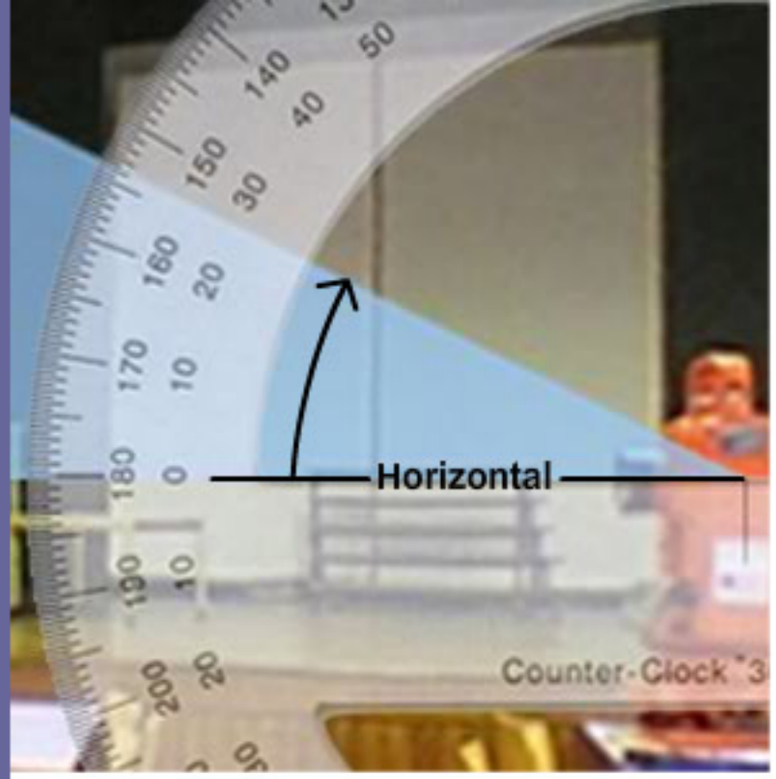
The angle is a **rotation** from

0 degrees (Horizontal)

to the **'Line of Sight' to the top of the wall**

Virtual site Classroom

leeds metropolitan university



What is the angle?

degrees

Virtual site Classroom

leeds metropolitan university

We also measure the distance from the centre of the theodolite to the staff, which gives us the **adjacent** length of the triangle.

To do this we can use the theodolite, or a laser measuring device, or a tape measure.

The distance in this case is **6.18m**

Virtual site Classroom

leeds metropolitan university

We know the theodolite was aligned **horizontally** to the ground when the staff reading was taken. We also know the staff is aligned **vertically** to the ground.

Therefore, the angle between the initial theodolite angle and the staff is a right angle, which is 90 degrees. This means the blue triangle is a **right-angled triangle**. We can use **trigonometry** to calculate the height of the wall.

Virtual site Classroom

leeds metropolitan university

θ (theta) is the mathematical symbol used to represent the angle between the **hypotenuse** and **adjacent** lengths of a triangle.

Because we have measured the **adjacent** length and **theta** angle, we can work out the length **opposite** the angle using this formula:

$$\tan\theta = \frac{\text{opp}}{\text{adj}}$$

We know the value of θ and adj but we don't know the value of opp so we rearrange the formula as:

$$\text{opp} = \text{adj} \times \tan\theta$$

Virtual site Classroom

leeds metropolitan university

In the previous slide we saw that:

opp = **adj** x **tan** θ

We know that the **adjacent** length is **6.18m**

and the θ (theta) angle is **26 degrees**

Applying these figures to the formula gives:
opp = **6.18m** x **tan 26**

You will need a scientific calculator
to calculate **opp**

Press the **tan** button on the calculator,
then enter **26** (On some calculators you may need to do this in the opposite order)
Then multiply by **6.18**

What is opp to 3 decimal places?

_____ m

Virtual site Classroom

leeds metropolitan university

In the previous slide we calculated the **opposite** length to be:

3.014m

We now add the reading from the theodolite we took earlier, which is the distance from the ground to the bottom of the blue triangle:

1.57m

Adding these two figures together will give us the **total height** of the wall.

3.014m +
1.57m

4.584m Total height

Well done.
You have completed the exercise.

ANSWERS

Q1: What is the staff reading?

Answer: 1.57m

Q2: What is the angle?

Answer: 26 degrees

Q3: What is opp to 3dp?

Answer: 3.014m
